Outline

1. The Uncapacitated Facility Location Problem
   - UFL Formulation
   - Cutting Planes

2. Developing a Solver
   - The ufl Class
   - COIN Tools
   - Putting It All Together

3. Additional Resources
The following are the input data needed to describe an instance of the uncapacitated facility location problem (UFL):

**Data**
- a set of depots \( N = \{1, \ldots, n\} \), a set of clients \( M = \{1, \ldots, m\} \),
- the unit transportation cost \( c_{ij} \) to service client \( i \) from depot \( j \),
- the fixed cost \( f_j \) for using depot \( j \)

**Variables**
- \( x_{ij} \) is the amount of the demand for client \( i \) satisfied from depot \( j \)
- \( y_j \) is 1 if the depot is used, 0 otherwise
The following is a mathematical programming formulation of the UFL

\[ \text{Minimize} \quad \sum_{i \in M} \sum_{j \in N} c_{ij} x_{ij} + \sum_{j \in N} f_j y_j \quad (1) \]

subject to

\[ \sum_{j \in N} x_{ij} = d_i \quad \forall i \in M, \quad (2) \]

\[ \sum_{i \in M} x_{ij} \leq (\sum_{i \in M} d_i) y_j \quad \forall j \in N, \quad (3) \]

\[ y_j \in \{0, 1\} \quad \forall j \in N \quad (4) \]

\[ 0 \leq x_{ij} \leq d_i \quad \forall i \in M, j \in N \quad (5) \]
The formulation presented on the last slide can be tightened by disaggregating the constraints (3).

\[ x_{ij} - d_jy_j \leq 0, \forall i \in M, j \in N. \]

Rather than adding the inequalities to the initial formulation, we can generate them dynamically.

Given the current LP solution, \( x^*, y^* \), we check whether

\[ x^*_{ij} - d_jy^*_j > \epsilon, \forall i \in M, j \in N. \]

We can also generate inequalities valid for generic MILPs.

If a violation is found, we can iteratively add the constraint to the current LP relaxation.
Here is the basic loop for tightening the initial formulation using the dynamically generated inequalities from the previous slide.

**Solving the LP relaxation**

1. Form the initial LP relaxation and solve it to obtain \((\hat{x}, \hat{y})\).
2. Iterate
   1. Try to generate a valid inequality violated by \((\hat{x}, \hat{y})\). If none are violated, STOP.
   2. Optionally, try to generate an improved feasible solution by rounding \(\hat{y}\).
   3. Solve the current LP relaxation of the initial formulation to obtain \((\hat{x}, \hat{y})\).
   4. If \((\hat{x}, \hat{y})\) is feasible, STOP. Otherwise, go to Step 1.

Putting It All Together

Data Members

C++ Class

```c++
class UFL {
private:
    OsiSolverInterface * si;
    double * trans_cost;  // c[i][j] -> c[xindex(i,j)]
    double * fixed_cost;  // f[j]
    double * demand;      // d[j]
    int M;                // number of clients (index on i)
    int N;                // number of depots (index in j)
    double total_demand;  // sum{j in N} d[j]
    int *integer_vars;

    int xindex(int i, int j) {return i*N + j;}
    int yindex(int j) {return M*N + j;}
};
```

Additional Resources

Methods

C++ Class

```c++
class UFL {
public:
    UFL(const char* datafile);
    ~UFL();
    void create_initial_model();
    double tighten_initial_model(ostream *os = &cout);
    void solve_model(ostream *os = &cout);
};
```
Open Solver Interface

- Uniform API for a variety of solvers: CBC, CLP, CPLEX, DyLP, FortMP, GLPK, Mosek, OSL, Soplex, SYMPHONY, the Volume Algorithm, XPRESS-MP supported to varying degrees.
- Read input from MPS or CPLEX LP files or construct instances using COIN-OR data structures.
- Manipulate instances and output to MPS or LP file.
- Set solver parameters.
- Calls LP solver for LP or MIP LP relaxation.
- Manages interaction with dynamic cut and column generators.
- Calls MIP solver.
- Returns solution and status information.
Cut Generator Library

- A collection of cutting-plane generators and management utilities.
- Interacts with OSI to inspect problem instance and solution information and get violated cuts.
- Cuts include:
  - Combinatorial cuts: AllDifferent, Clique, KnapsackCover, OddHole
  - Flow cover cuts
  - Lift-and-project cuts
  - Mixed integer rounding cuts
  - General strengthening: DuplicateRows, Preprocessing, Probing, SimpleRounding
COIN LP Solver

- High-quality, efficient LP solver.
- Simplex and barrier algorithms.
- QP with barrier algorithm.
- Interface through OSI or native API.
- Tight integration with CBC (COIN-OR Branch and Cut MIP solver).
The Uncapacitated Facility Location Problem
Developing a Solver
Additional Resources

COIN Branch and Cut

- State of the art implementation of branch and cut.
- Tight integration with CLP, but can use other LP solvers through OSI.
- Uses CGL to generate cutting planes.
- Interface through OSI or native API.
- Many customization options.
The initialize_solver() Method

Initializing the LP solver

```cpp
#if defined(COIN_USE_CLP)

#include "OsiClpSolverInterface.hpp"
typedef OsiClpSolverInterface OsiXxxSolverInterface;

#elif defined(COIN_USE_CPX)

#include "OsiCpxSolverInterface.hpp"
typedef OsiCpxSolverInterface OsiXxxSolverInterface;

#endif

OsiSolverInterface* UFL::initialize_solver() {
    OsiXxxSolverInterface* si =
        new OsiXxxSolverInterface();
    return si;
}
```
The \texttt{create\_initial\_model()} Method

Creating Rim Vectors

\begin{verbatim}
CoinIotaN(integer_vars, N, M * N);
CoinFillN(col_lb, n_cols, 0.0);

int i, j, index;

for (i = 0; i < M; i++) {
    for (j = 0; j < N; j++) {
        index = xindex(i,j);
        objective[index] = trans_cost[index];
        col_ub[index] = demand[i];
    }
}
CoinFillN(col_ub + (M*N), N, 1.0);
CoinDisjointCopyN(fixed_cost, N, objective + (M * N));
\end{verbatim}
The create_initial_model() Method

Creating the Constraint Matrix

CoinPackedMatrix * matrix =
    new CoinPackedMatrix(false,0,0);

matrix->setDimensions(0, n_cols);
for (i=0; i < M; i++) { //demand constraints:
    CoinPackedVector row;
    for (j=0; j < N; j++) row.insert(xindex(i,j),1.0);
    matrix->appendRow(row);
}

for (j=0; j < N; j++) { //linking constraints:
    CoinPackedVector row;
    row.insert(yindex(j), -1.0 * total_demand);
    for (i=0; i < M; i++) row.insert(xindex(i,j),1.0);
    matrix->appendRow(row);
}
Loading and Solving the LP Relaxation

Loading the Problem in the Solver

```c
si->loadProblem(*matrix, col_lb, col_ub,
               objective, row_lb, row_ub);
```

Solving the Initial LP Relaxation

```c
si->initialSolve();
```
The **tighten_initial_model()** Method

**Tightening the Relaxation—Custom Cuts**

```cpp
const double* sol = si->getColSolution();
int newcuts = 0, i, j, xind, yind;
for (i = 0; i < M; i++) {
    for (j = 0; j < N; j++) {
        xind = xindex(i,j); yind = yindex(j);

        if (sol[xind] - (demand[i] * sol[yind]) >
            tolerance) { // violated constraint
            CoinPackedVector cut;
            cut.insert(xind, 1.0);
            cut.insert(yind, -1.0 * demand[i]);
            si->addRow(cut, -1.0 * si->getInfinity(), 0.0);
            newcuts++;
        }
    }
}
```
The \texttt{tighten\_initial\_model()} Method

Tightening the Relaxation—CGL Cuts

\begin{verbatim}
OsiCuts cutlist;
si->setInteger(integer_vars, N);
CglGomory * gomory = new CglGomory;
gomory->setLimit(100);
gomory->generateCuts(*si, cutlist);
CglKnapsackCover * knapsack = new CglKnapsackCover;
knapsack->generateCuts(*si, cutlist);
CglSimpleRounding * rounding = new CglSimpleRounding;
rounding->generateCuts(*si, cutlist);
CglOddHole * oddhole = new CglOddHole;
oddhole->generateCuts(*si, cutlist);
CglProbing * probe = new CglProbing;
probe->generateCuts(*si, cutlist);
si->applyCuts(cutlist);
\end{verbatim}
The `solve_model()` Method

Calling the Solver (Built-In MIP)

```cpp
si->setInteger(integer_vars, N);

si->branchAndBound();
if (si->isProvenOptimal()) {
    const double * solution = si->getColSolution();
    const double * objCoeff = si->getObjCoefficients();
    print_solution(solution, objCoeff, os);
}
else
    cerr << "B&B failed to find optimal" << endl;
return;
```
The solve_model() Method

Calling the Solver (CLP Requires Separate MIP)

```
CbcModel model(*si);
model.branchAndBound();
if (model.isProvenOptimal()) {
    const double * solution = model.getColSolution();
    const double * objCoeff = model.getObjCoefficients();
    print_solution(solution, objCoeff, os);
} 
else
    cerr << "B&B failed to find optimal" << endl;
return;
```
